# MLDS-413 Introduction to Databases and Information Retrieval

# Homework 1: Number representations

Name 1:		
NetID 1:		
Name 2:		
NetID 2:		

# Instructions

You should submit this homework assignment via Canvas. Acceptable formats are word files, text files, and pdf files. Paper submissions are not allowed and they will receive an automatic zero.

As explained during lecture and in the syllabus, assignments are done in groups. The groups have been created and assigned. Each group needs to submit only one assignment (i.e., there is no need for both partners to submit individually the same homework assignment).

Each group can submit solutions multiple times (for example, you may discover an error in your earlier submission and choose to submit a new solution set). We will grade only the last submission and ignore earlier ones.

Make sure you submit your solutions before the deadline. The policies governing academic integrity, tardiness and penalties are detailed in the syllabus.

# Question 1. Unsigned Integer Representation (10 points – 1 point per row)

Please fill out the blank parts of the table below to (i) express the following numbers in binary, (ii) calculate their hexadecimal representation (as shown in class), and (iii) calculate their decimal value as a sum of powers of two.

For example:  $52_{10} = 0011\ 0100_2 = 0x34 = 1*2^5 + 1*2^4 + 0*2^3 + 1*2^2 + 0*2^1 + 0*2^0 = 32 + 16 + 4$ 

	DECIMAL NUMBER	BINARY	HEXADECIMAL	SUM OF POWERS OF TWO
EXAMPLE	52	0011 0100	0x34	32 + 16 + 4
1A)	6	0110	0x6	4 + 2
1B)	19	0001 0011	0x13	16 + 2 + 1
1C)	22	0001 0110	0x16	16 + 4 + 2
1D)	38	0010 0110	0x26	32 + 4 + 2
1E)	42	0010 1010	0x2A	32 + 8 + 2
1F)	155	1001 1011	0x9B	128 + 16 + 8 + 2 + 1
1G)	612	0010 0110 0100	0x264	512 + 64 + 32 + 4
1H)	1819	0111 0001 1011	0x71B	1024 + 512 + 256 + 16 + 8 + 2 + 1
1I)	2293	1000 1111 0101	0x8F5	2048 + 128 + 64 + 32 + 16 + 4 + 1
1J)	3176	1100 0110 1000	0xC68	2048 + 1024 + 64 + 32 + 8

## Question 2. Signed Integer Representation (10 points – 1 point per row)

Please fill out the blank parts of the table below as needed to calculate the 8-bit two's complement binary representation of the following signed decimal numbers. |x| denotes the absolute value of x. If particular number(s) below cannot be represented as 8-bit signed binary integer(s), please indicate which one(s) and explain why. The explanation will then carry the points of the corresponding row(s). Please remember that:

- You may need to add zeros to the left of the number to make it an 8-bit binary number.
- In two's complement signed integer representation, for every (positive or negative) integer x, it holds: -x = -x + 1, where -x is the complement of x (calculated by flipping the bits of x).
- If you don't need a column to calculate the 8-bit signed integer binary representation of a number, you can leave that column blank (as in example 1).

For example:  $82_{10} = 0101 \ 0010_2$ . Note that we added a zero at the front to make it an 8-bit binary number. The sign bit (most significant bit of its 8-bit binary representation) is 0, indicating a positive integer, so the 8-bit signed integer binary representation of  $82_{10}$  is  $0101 \ 0010_2$ .

However, to calculate the 8-bit signed integer representation of -82 we need to calculate its two's complement. We have  $|-82_{10}| = 82_{10} = 0101\ 0010_2$ . Flipping the bits gives 1010 1101<sub>2</sub>. Finally, adding one gives 1010 1110<sub>2</sub>. Thus, the 8-bit signed binary representation of -82<sub>10</sub> is 1010 1110<sub>2</sub>.

	VALUE OF INTEGER X	X    IN 8-BIT BINARY	~ X  IF NEEDED	8-BIT SIGNED INTEGER REPRESENTATION
EXAMPLE 1	82	$0101\ 0010 = 82_{10}$		$0101\ 0010 = 82_{10}$
EXAMPLE 2	-82	$0101\ 0010 = 82_{10}$	1010 1101	$1010\ 1110 = -82_{10}$
2A)	-1	0000 0001	1111 1110	1111 1111
2B)	-19	0001 0011	1110 1100	1110 1101
2C)	22	0001 0110		0001 0110
2D)	-38	0010 0110	1101 1001	1101 1010
2E)	-42	0010 1010	1101 0101	1101 0110
2F)	68	0100 0100		0100 0100
2G)	-100	0110 0100	1001 1011	1001 1100
2H)	127	0111 1111		0111 111
2I)	128			
2J)	-129			

If you found any numbers that you cannot represent as 8-bit signed integers, indicate which ones and why they cannot be represented in the space below.

There are two numbers that cannot be represented as 8-bit signed integers: 2I and 2J. The maximum and minimum values that can be represented by an 8-bit signed integer are +127 and -128, respectively. Thus, both 128 and -129 are out of the range of 8-bit signed integers, and require more than 8 bits to be represented.

### Question 3. Binary Pattern Representation (10 points)

### **BIT PATTERN 1**

#### **BIT PATTERN 2**

1101 1110 1010 1101 1011 1110 1110 1111

0100 1100 0100 1111 0100 1100 0010 0001

What value does bit pattern 1 represent when interpreted as a

3a) (2 points) 32-bit signed integer in two's complement arithmetic?

Say the bit pattern represents number x. The number x is negative (the most significant bit is 1). To calculate its magnitude, |x|, we need to calculate -x. We know that -x =  $\sim$ x + 1. Thus, we'll calculate its two's complement and then add 1 to it:

Bit pattern: 1101 1110 1010 1101 1011 1110 1110 1111 Flip bits: 0010 0001 0101 0010 0100 0001 0001 0000 Hex equivalent: 0x 2 1 5 4

Decimal value of the hex number above as a sum of powers of 16 (we use base-16 arithmetic to do fewer calculations):  $2*16^7 + 1*16^6 + 5*16^5 + 2*16^4 + 4*16^3 + 1*16^2 + 1*16^1 + 0*16^0 = 559,038,736$ .

So,  $\sim x = 559,038,736$ . Thus,  $-x = \sim x + 1 = 559,038,737$ .

Answer: x = -559,038,737

### 3b) (2 points) 32-bit <u>unsigned</u> integer?

Say the bit pattern represents number x. Since we interpret the bit pattern as an unsigned integer, we only need to calculate its magnitude:

# 3c) (1 point) write the value in question 3b as a hexadecimal number

We match each 4-bit pattern to the corresponding hexadecimal digit.

Answer: 0xDEADBEEF

What value does bit pattern 2 represent when interpreted as a

### 3d) (2 points) 32-bit signed integer in two's complement arithmetic?

Say the bit pattern represents number x. The number is positive (the most significant bit is 0). Thus, we only need to calculate its magnitude:

Bit pattern: 0100 1100 0100 1111 0100 1100 0010 0001 Hex equivalent: 0x 4 C  $\mathbf{F}$ 4 4 C 2

Decimal, as a sum of powers of 16:  $4*16^7 + 12*16^6 + 4*16^5 + 15*16^4 + 4*16^3 + 12*16^2 + 2*16^1 + 1*16^0 = 1,280,265,249$ .

Similarly, as a sum of powers of 2:  $2^{30} + 2^{27} + 2^{26} + 2^{22} + 2^{19} + 2^{18} + 2^{17} + 2^{16} + 2^{14} + 2^{11} + 2^{10} + 2^{5} + 2^{0}$ Answer: x = 1,280,265,249

### 3e) (2 points) 32-bit <u>unsigned</u> integer?

Say the bit pattern represents number x. The answer is the same as above. The sum of powers of two is the same for the same bit pattern.

Answer: x = 1,280,265,249

### 3f) **(1 point)** UTF-8 text?

All bytes start with bit 0, so the text uses only ASCII characters. We match each 8-bit pattern to the corresponding character in the ASCII table shown at the lecture slides. Bit pattern 2 corresponds to: LOL!

## Question 4. Accuracy of Integer and Floating Point Representations (20 points – 1 per row)

In the table below, answer "exactly," "approximately," or "no way" to indicate how the following (base ten) numbers can be represented as 32-bit signed integers, 64-bit signed integers, single precision (32-bit) floats, and double precision (64-bit) floats. If the number can be rounded to a value that is representable and the relative error is less than 10<sup>-3</sup>, then the best answer is "approximately." For example, I would say that 2.5 is "no way" 3, but 2.9999999 is "approximately" 3. The relative error definition is in the reading material and was explained in the lab session.

You can use online floating-point conversion tools (e.g., <a href="http://www.binaryconvert.com/convert\_float.html">http://www.binaryconvert.com/convert\_float.html</a>).

	BASE TEN NUMBER	32-BIT <i>SIGNED</i> INTEGER	64-BIT <i>SIGNED</i> INTEGER	32-BIT FLOATING POINT	64-BIT FLOATING POINT
EXAMPLE	$1.0 \times 10^{20}$	no way	no way	approximately	exactly
4A	-0.5	no way	no way	exactly	exactly
4B	1/3 (one third)	no way	no way	approximately	approximately
4C	0.1	no way	no way	approximately	approximately
4D	1/16 (one sixteenth)	no way	no way	exactly	exactly
<b>4E</b>	17.5	no way	no way	exactly	exactly
4F	4,000,000,000	no way	exactly	exactly	exactly
4G	-4,000,000,001	no way	exactly	approximately	exactly
4H	$\sqrt{2}$	no way	no way	approximately	approximately
<b>4</b> I	2,000,000,000	exactly	exactly	exactly	exactly
4J	2,000,000,001	exactly	exactly	approximately	exactly
4K	20,000,000	exactly	exactly	exactly	exactly
4L	20,000,000.25	approximately	approximately	approximately	exactly
<b>4M</b>	33,554,432.25	approximately	approximately	approximately	exactly
4N	33,554,432.9	approximately	approximately	approximately	approximately
4O	9,123,000,000,000,000,000	no way	exactly	approximately	exactly
4 <b>P</b>	-9,123,123,123,000,000,000	no way	exactly	approximately	approximately
4Q	9,123,123,123,123,123,123	no way	exactly	approximately	approximately
4R	pi	no way	no way	approximately	approximately
<b>4S</b>	infinity	no way	no way	exactly	exactly
<b>4T</b>	zero	exactly	exactly	exactly	exactly
